

Marking Guide

The rubric used for marking will be provided on Canvas at the bottom of the assignment page.

Rubric

GAIT - A1 Rubric

Criteria	Ratings	Pts
This criterion is linked to a Learning Outcome Steering Behaviours Implement realistic movement for all agents: Arrive: Frog slows near the target and stops cleanly. Flocking: Flies use separation, cohesion, and alignment to move as a group. Flee: Flies escape smoothly from nearby threats. Avoidance: Snakes steer around obstacles while chasing the frog.	6 to >4.0 pts Excellent All steering behaviours work smoothly and realistically with no jitter, overshoot, or collision issues. 4 to >2.0 pts Partially implemented Some behaviours work but lack polish or stability. 2 to >0 pts Not implemented Agents move linearly, ignore obstacles, or show no reactive motion.	6 pts
This criterion is linked to a Learning Outcome Finite State Machines (FSMs) Program agent states and transitions: Flies: Switch between flocking and fleeing depending on nearby threats. Snakes: Patrol, chase, or return home based on distance and conditions.	4 to >2.0 pts Excellent All FSM transitions function logically and produce believable behaviour. 2 to >0 pts Fair Partially implemented: Some transitions or conditions missing, causing odd state changes. Not implemented: Agents stay stuck in one state or show no reactive change.	4 pts

This criterion is linked to a Learning Outcome Advanced AI Extensions add creative AI enhancements beyond the basics: Pursue / Evade: Predict movement for smarter chasing and fleeing. Confused / Idle / Hurt states: Add extra realism with timed wandering, resting, and damage reactions.	10 to >8.0 pts Excellent Fully implemented: All extensions function as intended and enrich gameplay behaviour. 8 to >4.0 pts Good Partially implemented: Some extensions work but lack polish or stability. 4 to >0 pts Fair Not implemented: Extra behaviours not functional or missing from the game.	10 pts
